Two-Way Radio Solutions

Handheld, mobile and base station communication solutions including interoperability with public safety and state agencies. DCAT can provide two-way radio service on your remote site using a repeater to connect all of your hand holds, mobiles, and base station radios. Using a repeater we can eliminate dead spots around your remote site. Using IP services we can then link these radios and our state wide digital trunked system back to your main office providing real time communications across all of your remote sites. With our GPS technologies we can also provide real time personnel and asset tracking, set limits for automatic alerts, and location logging all visible real time on mapping software. Our radios also feature short digital messaging (text message), digital encryption with private and group talk abilities. New FCC regulations may require you to upgrade your current system to meet new narrow band requirements. We can evaluate your existing analog radio system and your company's future needs to meet these new requirements.

Data Solutions

Stop relying on expensive satellite technologies, DCAT can provide basic and high bandwidth secure data services to your remote location. Our extensive inventory of microwave back hauls is available to meet your locations bandwidth requirements. With these microwave radios we can link you to one of our points of presence or other network access (Fiber, Telco, Cable company). Using DCAT's advanced technologies we can connect your sites together, along with your main office and other locations using secured virtual private networking (VPN) or Multi protocol Label Switching (MPLS). This will provide you with a secure local network throughout your service area.

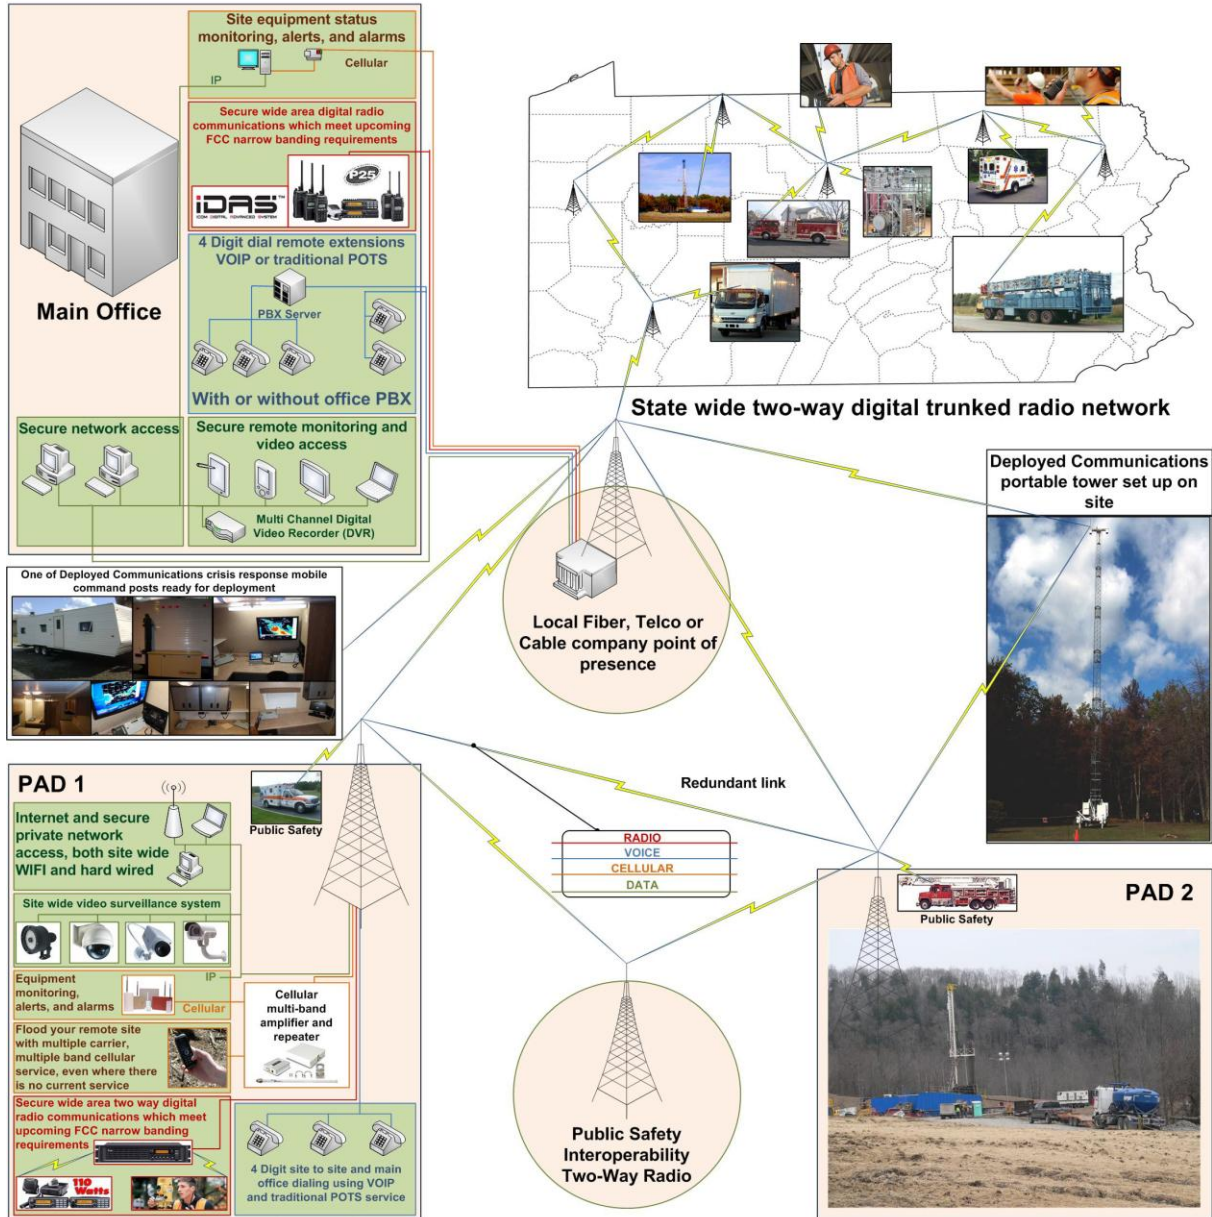

Voice Solutions

We can provide Cellular, VOIP, or POTS technologies to your remote site even with no local telco facilities or cellular service near the site. Your remote site can even be an extension of your main office, simple 4 digit dialing will ring a remote site telephone as if it were part of your local PBX. Remote sites also have 4 digit dialing ability for calling each other. You can now rely on real time communications throughout your company's footprint. DCAT can also provide cellular service to your remote site using one of our cellular on site extenders. This will provide your company with the piece of mind that problems can be reported in real time from your site.

Keystone Digital Network...

A new state wide Digital Communications Network

Portable Towers

DCAT has a wide inventory of portable towers to fit any need. We can provide towers ranging from 50 feet all the way up to 125 feet.

Site Alerts and Alarms

DCAT can provide cellular, data, or POTS line technologies for remote site monitoring. We can either remotely monitor typical security products or you can provide us a signal from your current system. The DCAT system can notify key personnel by SMS or e-mail of alarm activations or equipment status.

Video Solutions

Using either cellular, local telco, or our remote data solutions we can provide your companies sites with multiple remote surveillance cameras viewable from any location or multiple locations of your choice. DCAT can provide a digital video recorder (DVR) either at the remote site or have all of the feeds brought into a DVR at your main office for viewing and archiving. Video cameras will not only allow you to monitor your pads, they can also be used to document trespassing or unauthorized dumping meant to harm your company's reputation. Our technology is so smart it can recognize and record vehicle license plates entering and exiting an area. DCAT can deploy stealth cameras to monitor entry areas a distance from your primary location. If needed we also have the ability to link a video equipped vehicle to your video solution. These mobile systems will link up on any of your sites where our services are deployed or locations with authorized internet access.

Crisis Response

DCAT can provide your company with contracted crisis response services including additional communications and a mobile command post that can be deployed to the site of an emergency. Our ICSTAC division can custom build a mobile or on site command post to meet your companies needs. We can also provide crisis response and emergency management training to your staff.
